The total waste water generation is 245 KLD. The waste water is treated into Sewage Treatment Plants (STP) of total capacity 300 KLD (already installed). Approximately 220 KLD treated water is being used in flushing & Cooling. 125 KLD of outsourced treated water is being used for gardening purpose. There will be no discharge of treated/untreated water to city drain from the project

v	Construction site shall be adequately barricaded before the construction begins. Dust, smoke & other air pollution prevention measures shall be provided for the building as well as the site. These measures shall include screens for the building under construction, continuous dust/ wind breaking walls all around the site (a least 3 meter height). Plastic/tarpaulin sheet covers shall be provided for vehicles bringing in sand, cement, murram and other construction materials prone to causing dust pollution at the site as well as taking out debris from the site	Project is completed now but during construction phase all necessary measures like operation of anti smog gun, dry construction, covering of building materials during transportation and storage, online monitoring of ambient air with a link being provided of the same to DPCC and video fencing and a link of the same being provided to DPCC for online monitoring was implemented.									
vi	Sand, murram, loose soil, cement, stored on site shall be covered adequately so as to prevent dust pollution	Sand, murram, loose soil, cement, stored on site are covered properly to prevent dust pollution									
vii	Wet jet shall be provided for grinding and stone cutting	Noted & Complied.									
viii	Unpaved surfaces and loose soil shall be adequately sprinkled with water to suppress dust	Noted, however there were no Unpaved surfaces and loose soil as it is existing building and only 1 floor was being constructed.									
ix	All construction and demolition debris shall be stored at the site (and not dumped on the roads or open spaces outside) before they are properly disposed. All demolition and construction waste shall be managed as per the provisions of the Construction and Demolition Waste Management Rules 2016	Noted & Complied. During project phase all demolition and construction waste were disposed off to DPCC approved authorized C&D waste recycler and entire C&D waste was managed as per the provisions of the Construction and Demolition Waste Management Rules 2016									
x	The diesel generator sets to be used during construction phase shall be low sulphur diesel type and shall conform to rules made under the Environment (Protection) Act, 1986	Yes, all the D.G Sets installed at Nexus Select CITYWALK confirm to the Environment (Protection) Act. And have additionally been provided with retrofit pollution control device (Chakra shield) which reduces PM emission to upto minimum of 70%. The installation certificate and test report of Chakra Shield as approved by CPCB approved laboratory. Certificates attached as Annexure 15									

xii	<p>The gaseous emissions from DG set shall be dispersed through adequate stack height as per CPCB standards. Acoustic enclosure shall be provided to the DG sets to mitigate the noise pollution. Low sulphur diesel shall be used. The location of the DG set and exhaust pipe height shall be as per the provisions of the Central Pollution Control Board (CPCB) norms</p>	<p>Yes, all the D.G Sets installed at Nexus Select CITYWALK confirm to the Environment (Protection) Act , the stack height is 6 meter above the roof level and DG sets are housed in acoustic enclosure to mitigate the pollution. And have additionally been provided with retrofit pollution control device (Chakra shield2.0) which reduces PM emission to upto minimum of 70%. The installation certificate and test report of Chakra Shield as approved by CPCB approved laboratory.</p> <p>Also Stack emission tests is being conducted on quarterly basis with MoEF approved laboratory. Last test done in March 2025. # **ADEQUACY REPORT ON SEWAGE TREATMENT PLANT FOR SELECT CITY WALK, SAKET, NEW DELHI DEVELOPERS: M/s SELECT INFRASTRUCTURE PVT LTD**

## **1.0 INTRODUCTION**

SELECT CITY WALK, SAKET, New Delhi, DEVELOPERS M/s SELECT INFRASTRUCTURE PVT LTD operating the commercial complex provides various facilities for tourist, visitors and entrepreneurs. The mall also runs a Cineplex in the complex. The commercial complex provides space to retailers, manufactures and dealers to showcase and sell their product. The Mall Complex has restaurant facility which caters the needs of visitors/ guests who visit the Commercial Complex. The water requirement of the Complex is for domestic use of the Guests/ visitors, employees housed and process water for cooking and washing operation in the Complex. The Commercial Complex has the facilities of central air conditioning, so a part from this water is used for flushing and gardening.

A concerted effort has been made by the management to contain the wastewater discharge and treat the same to control the effluent quality in order to comply with the requirements of DPCC. A detailed analysis of the control system has been made in order to determine the effectiveness of the control system and the same was further checked by monitoring specific stream and analyzing the same.

The Mall Complex was visited on 06-12-2012 by a team of experts from Delhi Technological University, Delhi, to inspect the operations of the unit, and also check the sewage treatment facilities installed at the site. Detailed discussion with the plant personnel were held regarding the general concept of pollution control system, its operation and maintenance. The report is being submitted on the basis of the visit and study of the processing involved in plant, for effluent generation, its treatment system, sampling and analysis of

the treated and raw wastewater generated and previous experience on the treatment of such effluent stream.

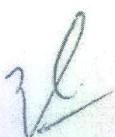

## **2.0 MANUFACTURING PROCESS**

The Mall activities being a service-oriented unit do not have a specific manufacturing system. The major wastewater is expected to be produced from domestic use by the visitors/ guests, kitchen, laundry and the employee stationed therein.

## **3.0 WASTEWATER QUANTITY AND CHARACTERISTICS**

### **3.1 Wastewater Quantity**

Wastewater is generated mainly as domestic wastewater because of use by visitors/guests, occupants and maintenance personnel stationed in The Mall activities. Apart from this a small quantity of wastewater is expected to be generated from floor washing, laundry and kitchen as well. The total wastewater quantity from the process system has been estimated on the basis of the working of various washing systems and the amount of water used in various steps. The total water requirement for the Commercial Complex has been estimated to be about 530 KLD including the amount for domestic purpose, central cooling, flushing and hardening. The water requirement for cooling operation, flushing and gardening is met from the treated wastewater of Sewage Treatment Plant. The estimated amount of wastewater generated from the operation is about 300 Kilolitres per day. The Commercial Complex has installed effluent treatment plant with the capacity to treat about 300 KLD, which shall be recycled to the extent of 100%. The unit has

provided dual plumbing system and wastewater treatment facilities to the extent of tertiary treatment level so as to make it enable to use the treated wastewater for reuse. The STP operates on the basis of continuous operation. Domestic water consumption within the Mall activities is obtained from DDA Tanker.

### **3.2 WASTEWATER CHARACTERISTICS**

The wastewater discharged from the individual process steps depend on the material being used at the particular time. The major contaminants in the wastewater suspended solids, oil & grease, Biochemical Oxygen demand and COD.

### **4.0 Wastewater Treatment**

The Commercial Complex has a well designed and installed sewage treatment plant system for the combined effluent from the sources mentioned above at the premises. The sewage treatment plant has been designed and installed on the basis of physico-chemical treatment followed by secondary biological treatment. The treatment plant has been designed on the basis of continuous operation

Entire sewage generated is pumped to the inlet of bar screens and oil & Grease trap where extraneous & floating matter is removed. The treated sewage from oil & grease trap flows to the equalization tank. The equalized effluent from equalization tank is taken to Clarifier, for the removal of suspended solids. Clarified effluent is then taken to aeration tank for the biological treatment. Effluent from aeration tank goes to the secondary settling tank for the removal of suspended solids generated in the aeration tank. The treated effluent from secondary settling tank taken to the clear water tank from where it is pumped to dual media filter followed by

activated carbon filter for the removal of dissolved gases and odours. Treated effluent from activated carbon filter is passed through Ultraviolet system for disinfection. Sludge is collected from the bottom of the settling tank and is sent to the sludge holding tank and then passed through the filter press for its conditioning before its final disposal. Finally, treated effluent is reused depending upon requirements.

# ECBC COMPLIANCE REPORT

## SELECT CITY WALK EXPANSION, NEW DELHI

### ECBC COMPLIANCE REPORT

## Introduction

The proposed commercial project development “SELECT CITY WALK” is an expansion of existing mall by SELECT Group. This is an iconic luxurious complex having featuring restaurants and Retail for its customer. As a strong step towards the social corporate responsibility and commitment for protecting the environment, the company has taken an initiative to build this building as a “Green Building”.

The objective of the Energy Analysis report is to evaluate Annual Energy usage and Energy Benefits associated with energy-efficient features. The report is prepared with the help of hourly simulation software which serves as an important tool to simulate various energy efficient measures particular to the building without being actually implementing. Energy efficiency measures in envelope, lighting and HVAC can be analyzed as well as thermal comfort of the occupants can be enhanced

## ECBC Compliance - General

To comply with the Code, buildings shall :-

- (a) have an Energy Performance Index Ratio (EPI Ratio) as defined in §3.1.1 that is less than or equal to 1 and
- (b) meet all mandatory requirements mentioned under §4.2, §5.2, §6.2, and §7.2.

The Energy Performance Index (EPI) of a building is its annual energy consumption in kilowatt-hours per square meter of the building. While calculating the EPI of a building, the area of unconditioned basements shall not be included. EPI can be determined by

EPI = Annual energy consumption in kWh /Total Built Up Area (excluding Basement)

The EPI Ratio of a building is the ratio of the EPI of the Proposed Building to the EPI of the Standard Building:

EPI ratio = EPI of Proposed Building / EPI of Standard Building

Where, Proposed Building is consistent with the actual design of the building, and complies with all the mandatory requirements of ECBC.

Standard Building is a standardized building that has the same building floor area, gross wall area and gross roof area as the Proposed Building, complies with the mandatory requirements §4.2, §5.2, §6.2, and §7.2, and minimally complies with prescriptive requirements of §4.3, §5.3, and §6.3 for ECBC Buildings.

To comply with the Code, EPI shall be calculated based on one of the following:

- (a) Prescriptive Method including Building Envelope Trade-off Method (see §3.2.2)
- (b) Whole Building Performance Method (see §3.2.3)

ECBC Buildings that demonstrate compliance through Prescriptive Method (§3.2.2) shall be deemed to have an EPI equal to the Standard Building EPI, and therefore an EPI Ratio of 1. ECBC+ Buildings

and Super ECBC Buildings that demonstrate compliance through Prescriptive Method shall be deemed to have an EPI Ratio equal to the EPI Ratios listed in §9.5 under the applicable building type and climate zone.

### **Whole Building Energy Performance Analysis**

A building complies with the Code using the Whole Building Performance (WBP) Method when the estimated annual energy use of the Proposed Design is less than that of the Standard Design, even though it may not comply with the specific provisions of the prescriptive requirements in §4 through §7. The mandatory requirements of §4 through §7 (§4.2, §5.2, §6.2, and §7.2) shall be met when using the WBP Method.

SELECT CITY WALK EXPANSION project has been modeled using the e-QUEST energy simulation software which is able to model energy flows on hourly basis for the entire year. This simulation tool has the capability to model hourly variations, lighting, HVAC equipment, daylight control and thermal zones. e-QUEST uses the DOE 2.2 simulation engine. The SLD has been created so that the single line rests on the interior side of the external walls and in the middle of the interior walls. For representing the weather conditions, project has used the ISHRAE weather file database to represent the external weather conditions. Provided below the chart indicating the steps flow of 'Whole Building Energy Performance Process',

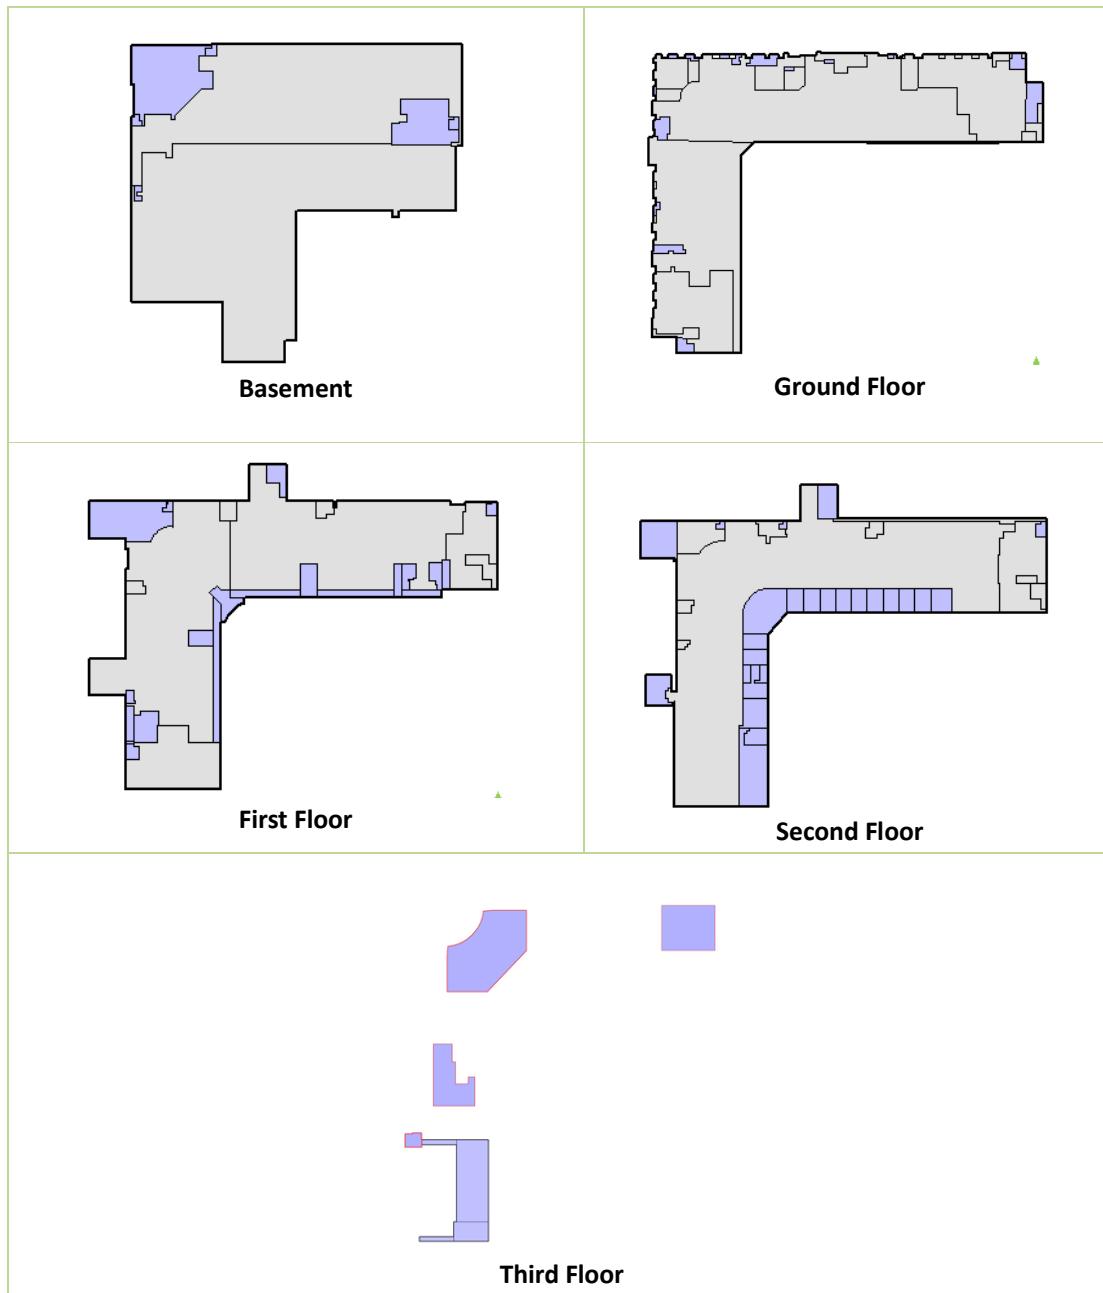

### **ECBC Compliance – Proposed**

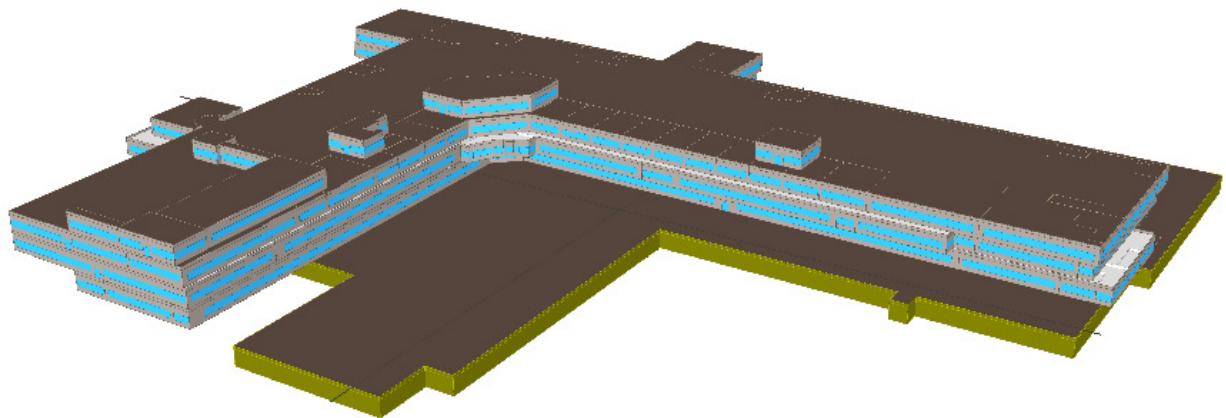

Project has proposed the following energy conservation or efficiency measures in compliance with ECBC requirement,

1. HVAC system design shall be planned with energy conservation features to reduce energy consumption and operating cost.
2. High efficient existing water cooled centrifugal chillers shall be used considering IPLV not to exceed 0.55 IKW/TR as per AHRI 550-590.
3. High efficient Water-cooled Screw chillers shall be used considering IPLV of 0.6 IKW/TR as per AHRI 550-590.
4. Chillers shall be used with ozone friendly HFC refrigerant
5. VFDs shall be used for secondary pumps, AHUs, bigger size ventilation fans and cooling towers.
6. Pressure independent control valve PICV/2-way valve shall be used in chilled water circuit
7. AHUs shall be selected area wise, so that some can be switched off during no occupancy periods and some can be used with lower speed during low occupancy period
8. USE of LED Luminaires.
9. Lighting controls to be done by Lux level sensors, Presence and occupancy detectors to minimise the energy requirement during low occupancy times in rest rooms.
10. Optimally sized water supply distribution piping.
11. Only common area lighting is under developer scope and thus the installation and controls will be provided accordingly.
12. Basement lighting is controlled by alternate circuit switch for reducing energy consumption during peak hours, by switching off the alternate lighting fixtures.

13. LED lighting for external areas and timer controlled feeder pillars are considered.
14. Voltage drop for feeders shall not exceed 2% at design load and voltage drop for branch circuit shall not exceed 3% at design load.
15. All 3 phases shall maintain 0.97 power factor at the point of connection.
16. EFF2 class energy efficient motors are considered for the plumbing system.
17. The power cabling shall be sized so that the distribution losses do not exceed 3% of the total power usage in Buildings.
18. Roof top SOLAR PV will be proposed to equivalent to 1% of total peak demand or connected load of the building. As per new expansion chart, the additional electrical load (KW) of new built up area will be 860 KW. Hence 10 KW of SOLAR PV will be installed on site
